The rat brain voltage-gated potassium channel protein Kv1. I is resistant to this toxin, but the voltage-gated potassium channel protein Shaker (Drosophila) is sensitive. The interaction site between the Shaker channel and this toxin is within the S5-S6 loop of the Shaker channel. In fish, this toxin induces hyperactivity, followed by continuous contraction and extension of major fins, without immobilization or death. Injection of this peptide together with the delta-conotoxin PVIA causes the sudden tetanus of prey (STOP) syndrome, which is a single, lethal "fin-pop" in envenomated fish. In mice, induces

SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus. TISSUE SPECIFICITY: Highly expressed in lung, moderately in he kidney, and at lower levels in the ovary and skeletal muscle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Biol.
                                                                                                                                                                                                                                                                                                                                                                                                                                      PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNT-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notth extracellular truncation (NEXT). This fragment is then cleaved by presentin dependent gamma-secretase to release a notth-derived peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Netl. Acad. Sci. U.S.A. 98:9026-9031(2001).
FUNCTION: Functions as a receptor for membrane-bound ligands
Jagged1, Jagged2 and Deltal to regulate cell-fate determination.
Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBB-J kappa and activates genes of the enhancer of split locus.
Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May regulate branching morphogenesis in the developing vascular system.
SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide honds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DEVELOPMENTAL STAGE: Highly expressed in endothelial cells during embryonic development from 9.0 d.p.c.
                                                                                                                                                                                                                                                                                                                                                                                                                          from the membrane

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                8
                                                                                                                                                                                                                                                                       domain (NICD) it forms a transcriptional activator complex with Affects the implementation of differentiation, proliferation and approved to programs. May be important for normal lymphocyte function. In altered form, may contribute to transformation or progression in some T-cell neoplasms. Involved in the maturation of both CD4+ and CD8+ cells in the thymus (By similarity). SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity). Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus (By proteolytical processing NICD is translocated to the nucleus (By contributed to the nucleu
                 brain stem and lung. Also present in most adult tissues where it is found mainly in lymphoid tissues.

PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TMF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              FUNCTION: Functions as a receptor for membrane-bound ligands Jagged1, Jagged2 and Deltal to regulate cell-fate determination Upon ligand activation through the released notch intracellular

PTM: Phosphorylated (By similarity).

DISEASE: Notch1 truncation is associated with neoplasia, a T-cel acute lymphoblastic leukemia.

SIMILARITY: BELONGS TO THE NOTCH FAMILY.

SIMILARITY: CONTAINS 36 EGF-LIKE DOMAINS.

SIMILARITY: CONTAINS 3 LIN/NOTCH REPEATS.

SIMILARITY: CONTAINS 5 ANK REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           s SWISS-PROT entry is copyright. proteclytical processing NICD is translocated to the nucleus.

-!- ALTERNATIVE PRODUCTS: 3 isoforms; 1 (shown here), 2 and 3; may be produced by alternative splicing.

-!- TISSUE SPECIFICITY: Highly expressed in the heart, moderately in the lung and placenta and at low levels in the liver, skeletal muscle, kidney, pancreas, spleen, lymph node, thymus, bone marrow and fetal liver. No expression was seen in adult brain or peripheral blood leukocytes.

-!- PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentin dependent gamma-secretase to release a notch-h-derived nontial containing the intermediate fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gray G.E., Mann R.S., Mitsiadis E., Hen.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IDENTIFICATION OF LIGANDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     FUNCTION: Functions as a receptor for membrane-bound ligands Jaggedl, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and
peptide) is polymorphic and the number of population (from 6 to 12).

                                                                                                                                                                                                                                                                      FUNCTION: Functions as a receptor for membrane-bound ligands Jaggedl, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation. May be involved in mesoderm development, somite formation and neurogeness. Involved in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       induction
                 proteolytical processing NICD is translocated to the ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and produced by alternative splicing.

This fragment is then cleaved by presentlin dependent gamma-secretase to release a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called neth over the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the convertion of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DEVELOPMENTAL STAGE: First detected in the mesoderm at By 8.5 d.p.c. highly expressed in presomitic mesoderm, and endothelial cells, while much lower levels are seen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     notch-derived peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ectoderm,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FUNCTION: Functions as a receptor for membrane-bound ligands Jagged1, Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). Acts instructively to control the cell fate determination of CNS multipotent progenitor cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              terminal fragment N(EC) which are probably linbonds (By similarity).
SUBCELLULAR LOCATION: Type I membrane protein.

notch-derived peptide containing the intracellular domain (from the membrane (By similarity).

-! PTM: Phosphorylated (By similarity).
-! SIMILARITY: BELONGS TO THE NOTCH FAMILY.
-! SIMILARITY: CONTAINS 36 EGF-LIKE DOMAINS.
-! SIMILARITY: CONTAINS 3 LIN/NOTCH REPEATS.
-! SIMILARITY: CONTAINS 5 ANK REPEATS.

PTM: Synthesized in the endoplasmic reticulum as an inactive which is proteolytically cleaved by a furin-like convertage trans-Golgi network before it reaches the plasma membrane to an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment cotch extracellular truncation (NEXT). This fragment is then cleaved by presentin dependent gamma-secretase to release a cleaved by presentin dependent gamma-secretase to release

an inactive form convertase in the membrane to yield

## Sequence Family Search of Proteins (/sqsfp)

In the sequence family search, each amino acid in the query has to match either the exact amino acid or a family member equivalent, as shown in the Family Equivalence Table below. The Family Equivalence Table is applied only to each common amino acid in the sequence. Specific uncommon amino acids may be included in the sequence; however, family equivalents only exist for the common amino acids. An amino acid family is based on a conservative substitution of amino acids sharing a similar chemical property. Each common amino acid in the query is converted to its family class members in a search. A match occurs on a query sequence if each amino acid is exactly matched or any of its family members are encountered. For example, the Hydrophobic-Aromatic family consists of the common amino acids F, W, and Y. If the amino acid F is specified within a sequence exact family search, it will match on amino acids F, W, or Y.

## FAMILY EQUIVALENCE TABLE

Family Class Name	Family Class Members				
Neutral-Weakly Hydrophobic	Ala (A), Gly (G), Pro (P), Ser (S), Thr (T)				
Hydrophilic-Acid Amine	Asn (N), Asp (D), Gln (Q), Glu (E)				
Hydrophilic-Basic	Arg (R), His (H), Lys (K)				
Hydrophobic	Ile (I), Met (M), Leu (L), Val (V)				
Hydrophobic-Aromatic	Phe (F), Trp (W), Tyr (Y)				
Crosslinking	Cys (C)

.kappa.-Conotoxin-PVIIA (.kappa.-PVIIA) is a 27-residue basic (+4) peptide from the venom of the predator snail Conus purpurascens. A single .kappa.-PVIIA mol. interrupts ion conduction by binding to the external mouth of Shaker K channels. The blockade of Shaker by .kappa.-PVIIA was studied at the single channel level in membrane patches from Xenopus oocytes. The amplitudes of blocked and closed events were undistinguishable, suggesting that the toxin interrupts ion conduction completely. Between -20 and 40 mV .kappa.-PVIIA increased the latency to the first opening by one order of magnitude in a concn.-independent fashion. Because .kappa.-PVIIA has higher affinity for the closed channels at high enough concn. to block >90% of the resting channels, the dissocn. rate could be estd. from the anal. of the first latency. At 0 mV, the dissocn. rate was 20 s-1 and had an effective valence of 0.64. The apparent closing rate increased linearly with [.kappa.-PVIIA] indicating an assocn. rate of 56 .mu.M-1 s-1. The toxin did not modify the fraction of null traces. This result suggests that the structural rearrangements in the external mouth contributing to the slow inactivation preserve the main geometrical features of the toxin-receptor interaction.

Journal

LANGUAGE:

English Mol. simulation techniques were applied to predict the interaction of the voltage-dependent Shaker potassium channel with the channel-blocking toxin .kappa.-conotoxin-PVIIA (PVIIA). A structural three-dimensional model of the extracellular vestibule of the potassium channel was constructed based on structural homologies with the bacterial potassium channel Kcsa, whose structure has been solved by x-ray crystallog. The docking of the PVIIA mol. was obtained by a geometric recognition algorithm, yielding 100 possible conformations. A series of residue-residue distance restraints, predicted from mutation-cycle expts., were used to select a small set of a plausible channel-toxin complex models among the resulting possible conformations. The four final conformations, with similar characteristics, can explain most of the single-point mutation expts. done with this system. The models of the Shaker-PVIIA interaction predict two clusters of amino acids, crit. for the binding of the toxin to the channel. The first cluster is the amino acids R2, I3, Q6 and K7 that form the plug of the toxin that interacts with the entrance to the selectivity filter of the channel. The second cluster of residues, R22, F23, N24 and K25, interacts with a channel region near to the external entrance of the pore vestibule. The consistency of the obtained models and the exptl. data indicate that the Shaker-PVIIA complex model is reasonable and can be used in further biol. studies such as the rational design of blocking agents of potassium channels and the mutagenesis of both toxins and potassium channels.

The invention relates to uses of .kappa.-conotoxin PVIIA, analogs and derivs. for activating ATP-sensitive potassium channels. The activation of ATP-sensitive potassium channels is useful for opening KATP channels which can be used to treat a wide range of disease and injury states, including cerebral and cardiac ischemia and asthma.

AB .kappa.-Conotoxin PVIIA (.kappa.-PVIIA), a 27-amino acid peptide with three disulfide crosslinks, isolated from the venom of Conus purpurascens, is the first conopeptide shown to inhibit the Shaker K+ channel. Recently, two groups independently detd. the soln. structure for .kappa.-PVIIA using NMR; although the structures reported were similar, two mutually exclusive models for the interaction of the peptide with the Shaker channel were proposed. The authors carried out a structure/function anal. of .kappa.-PVIIA, with alanine substitutions for all amino acids postulated to be key residues by both groups. The authors' data are consistent with the crit. dyad model developed by Menez and co-workers for polypeptide antagonists of K+ channels. In the case of

.kappa.-PVIIA, Lys7 and Phe9 are essential for activity as predicted by Savarin et al. these workers also correctly predicted an important role for Lys25. Thus, although .kappa.-conotoxin PVIIA has no obvious sequence homol. to polypeptide toxins from other venomous animals that interact with voltage-gated K+ channels, there may be convergent functional features in diverse K+ channel polypeptide antagonists.

.kappa.-Conotoxin-PVIIA (.kappa.-PVIIA) belongs to a family of peptides ΑB derived from a hunting marine snail that targets to a wide variety of ion channels and receptors. .kappa.-PVIIA is a small, structurally constrained, 27-residue peptide that inhibits voltage-gated K channels. Three disulfide bonds shape a characteristic four-loop folding. The spatial localization of pos. charged residues in .kappa.-PVIIA exhibits strong structural mimicry to that of charybdotoxin, a scorpion toxin that occludes the pore of K channels. The authors studied the mechanism by which this peptide inhibits Shaker K channels expressed in Xenopus oocytes with the N-type inactivation removed. Chronically applied to whole oocytes or outside-out patches, .kappa.-PVIIA inhibition appears as a voltage-dependent relaxation in response to the depolarizing pulse used to activate the channels. At any applied voltage, the relaxation rate depended linearly on the toxin concn., indicating a bimol. stoichiometry. Time consts. and voltage dependence of the current relaxation produced by chronic applications agreed with that of rapid applications to open channels. Effective valence of the voltage dependence, z.delta., is .apprx.0.55 and resides primarily in the rate of dissocn. from the channel, while the assocn. rate is voltage independent with a magnitude of 107-108 M-1s-1, consistent with diffusion-limited binding. Compatible with a purely competitive interaction for a site in the external vestibule, tetraethylammonium, a well-known K-pore blocker, reduced .kappa.-PVIIA's assocn. rate only. Removal of internal K+ reduced, but did not eliminate, the effective valence of the toxin dissocn. rate to a value <0.3. This trans-pore effect suggests that: (a) as in the .alpha.-KTx, a pos. charged side chain, possibly a Lys, interacts electrostatically with ions residing inside the Shaker pore, and (b) a part of the toxin occupies an externally accessible K+ binding site, decreasing the degree of pore occupancy by permeant ions. The authors conclude that, although evolutionarily distant to scorpion toxins, .kappa.-PVIIA shares with them a remarkably similar mechanism of inhibition of K channels.

English LANGUAGE:

.kappa.-Conotoxin PVIIA is the first conotoxin known to interact with voltage-gated potassium channels by inhibiting Shaker-mediated currents. The authors studied the mechanism of inhibition and concluded that PVIIA blocks the ion pore with a 1:1 stoichiometry and that binding to open or closed channels is very different. Open-channel properties are revealed by relaxations of partial block during step depolarizations, whereas double-pulse protocols characterize the slower reequilibration of closed-channel binding. In 2.5 mM-[K+]o, the IC50 rises from a tonic value of .apprx.50 to .apprx.200 nM during openings at 0 mV, and it increases e-fold for about every 40-mV increase in voltage. The change involves mainly the voltage dependence and a 20-fold increase at 0 mV of the rate of PVIIA dissocn., but also a fivefold increase of the assocn. rate. PVIIA binding to Shaker .DELTA.6-46 channels lacking N-type inactivation or to wild phenotypes appears similar, but inactivation partially protects the latter from open-channel unblock. Raising [K+]o to 115 mM has little effect on open-channel binding, but increases almost 10-fold the tonic IC50 of PVIIA due to a decrease by the same factor of the toxin rate of assocn. to closed channels. In analogy with charybdotoxin block, the authors attribute the acceleration of PVIIA dissocn. from open channels to the voltage-dependent occupancy by K+ ions of a site at the outer end of the conducting pore. The authors also argue that the occupancy of this site by external cations antagonizes on binding to closed channels, whereas the apparent competition disappears in open channels if the competing cation can move along the pore. It is concluded that PVIIA can also be a valuable tool for probing the state of ion permeation inside the pore.

AUTHOR(S):

AB .kappa.-Conotoxin PVIIA from the venom of Conus purpurascens is the first cone snail toxin that was described to block potassium channels. We synthesized chem. this toxin and showed that its disulfide bridge pattern is similar to those of .omega.- and .delta.-conotoxins. .kappa.-Conotoxin competes with radioactive .alpha.-dendrotoxin for binding to rat brain synaptosomes, confirming its capacity to bind to potassium channels; however, it behaves as a weak competitor. The three-dimensional structure of .kappa.-conotoxin PVIIA, as elucidated by NMR spectroscopy and mol. modeling, comprises two large parallel loops stabilized by a triple-stranded antiparallel .beta.-sheet and three disulfide bridges. The overall fold of .kappa.-conotoxin is similar to that of calcium channel-blocking .omega.-conotoxins but differs from those of potassium channel-blocking toxins from sea anemones, scorpions, and snakes. Local topogs. of .kappa.-conotoxin PVIIA that might account for its capacity to recognize Kv1-type potassium channels are discussed.

AB The three-dimensional structure of PVIIA resembles the triple- stranded .beta. sheet/cystine-knot motif formed by a no. of toxic and inhibitory peptides. Subtle structural differences, predominantly in loops 2 and 4, are obsd. between PVIIA and other conotoxins with similar structural frameworks, however. Electrophysiol. binding data suggest that PVIIA blocks channel currents by binding in a voltage-sensitive manner to the external vestibule and occluding the pore. Comparison of the electrostatic surface of PVIIA with that of the well-characterized potassium channel blocker charybdotoxin suggests a likely binding orientation for PVIIA. Although the structure of PVIIA is considerably different to that of the .alpha.K scorpion toxins, it has a similar mechanism of channel blockade. On the basis of a comparison of the structures of PVIIA and charybdotoxin, we suggest that Lys19 of PVIIA is the residue which is responsible for phys. occluding the pore of the potassium channel.

SOURCE:

AΒ .kappa.-Conotoxin PVIIA (.kappa.-PVIIA), a 27-amino acid toxin from Conus purpurascens venom that inhibits the Shaker potassium channel, was chem. synthesized in a biol. active form. The disulfide connectivity of the peptide was detd. This is the first Conus peptide known to target K+ channels. Although the Shaker K+ channel is sensitive to .kappa.-PVIIA, the rat brain Kv1.1 subtype is resistant. Chimeras between Shaker and the Kv1.1 K+ channels were constructed and expressed in Xenopus oocytes. Only channels contg. the putative pore-forming region between the fifth and sixth transmembrane domains of Shaker retained toxin sensitivity, indicating that the toxin target site is in this region of the channel. Evidence is presented that .kappa.-PVIIA interacts with the external tetraethyl-ammonium binding site on the Shaker channel. Although both .kappa.-PVIIA and charybdotoxin inhibit the Shaker channel, they must interact differently. The F425G Shaker mutation increases charybdotoxin affinity by 3 orders of magnitude but abolishes .kappa.-PVIIA sensitivity. The precursor sequence of .kappa.-PVIIA was deduced from a cDNA clone, revealing a prepropeptide comprising 72 amino acids. The N-terminal region of the .kappa.-PVIIA prepropeptide exhibits striking homol. to the .omega.-, .mu.O-, and .delta.-conotoxins. Thus, at least four pharmacol. distinct superfamilies of Conus peptides belong to the same "O" superfamily, with the .omega. - and .kappa. - conotoxins forming one branch, and the .delta. - and .mu.O-conotoxins forming a second major branch. An ew peptide, .kappa.-conotoxin PVIIA, is disclosed. This peptide is found naturally in the cone snail Conus purpurascens and has the amino acid sequence Cys-Arg-Ile-Xaa-Asn-Gln-Lys-Cys-Phe-Gln-His-Leu-Asp-Asp-Cys-Cys-Ser-Arg-Lys-Cys-Asn-Arg-Phe-Asn-Lys-Cys-Val where Xaa represents 4-trans-hydroxyproline, hydroxyproline or proline. This peptide together with a previously disclosed peptide, .delta.-conotoxin PVIA, act synergistically to rapidly immobilize fish which are injected with the two peptides. Injection of .kappa.-conotoxin PVIIA alone results in different symptoms with an injected fish becoming hyperactive and then contracting and suddenly extending all major fins. This fin-popping occurs repeatedly resulting in a series of jerky movements, but injection of only .kappa.-conotoxin PVIIA does not immobilize or kill the fish.
